

Ben Stone

AI Automation & Agentic Systems

I turn messy business processes into working AI systems - with named responsibilities, real integrations, visible failure states, and human controls where they matter.

SELECTED SYSTEMS

FinanceOS + Cato

FINANCE AUTOMATION

Cato is the orchestration layer for FinanceOS. It routes accounting work across 14 Genesis specialists for revenue, cash, AP, AR, commissions, close, journals, treasury and other finance functions across six entities. Xero actions are bounded to reads and draft proposals, with human approval for consequential writes.

SwarmSync

AGENT VERIFICATION

SwarmSync is the verification layer I built around autonomous-agent execution. VerifyAPI captures what an agent actually called and what changed; AuditProof turns that evidence into a reviewable proof trail. The goal is simple: do not accept “done” unless the system can prove it.

InvoiceProof

DOCUMENT VERIFICATION

InvoiceProof checks invoices before they become accounting actions. It extracts invoice fields, ties material values back to source evidence, validates totals and routes uncertain or inconsistent documents for review instead of silently passing them downstream.

Real-Time Sales AI Coach

LIVE SALES ASSISTANCE

A live-call coaching system in active development. It streams call context, detects objections and buying signals, retrieves relevant product knowledge and suggests a concise response or next question to the salesperson while the conversation is happening.

WHAT THESE PROJECTS SHOW

Business-to-system translation	I start with the actual process, not the model. FinanceOS began as fragmented finance work; the architecture came from mapping who owns each decision and where the evidence lives.
Orchestration, not one giant agent	Cato routes work to narrow Genesis specialists rather than asking one model to understand every accounting function.
Verification before trust	SwarmSync and InvoiceProof exist because model confidence is not proof that an action happened or a number is correct.
Human control by design	FinanceOS can gather, analyze and prepare work automatically while keeping high-risk accounting actions behind explicit approval.

From business problem to working system

The common pattern across FinanceOS, SwarmSync, InvoiceProof and the Sales AI Coach.

● PROJECT-BY-PROJECT RESPONSIBILITY

Project	What I designed / built	Why it exists
FinanceOS + Cato	Finance orchestration, agent routing, entity context, Xero boundaries, reporting flows	Turning fragmented finance work into one governed operating loop
Genesis Agents	14 bounded finance specialists with one job each	Reduce cross-domain confusion and make permissions/audits understandable
SwarmSync	VerifyAPI + AuditProof execution evidence and verification patterns	Separate agent claims from evidence that work really happened
InvoiceProof	Invoice extraction, source evidence, deterministic checks, exception routing	Keep bad or unsupported invoice data from silently reaching accounting
Sales AI Coach	Streaming context, objection detection, retrieval and live response guidance	Give reps useful help during the call, not only after it

THE ROLE I FIT BEST

AI automation / agentic-systems roles where I can sit between operations and engineering: understand the messy process, decide what should be automated, build the system, and prove it works.
